

ABSTRACT

In an UDDI web service registry system based on an ebXML registry, a first client system supports a web service
5 based on an UDDI protocol and transceives an UDDI message.
An UDDI registry processes a service request of the UDDI message. A second client system supports a web service based on an ebXML protocol and transceives an ebXML message.
An ebXML registry processes service requests of the
10 compatible ebXML message. An UDDI service module transforms the UDDI message into a compatible ebXML message and transmits the ebXML message to the ebXML registry.
